1) Introduction

1.1) Purpose

The purpose of the Animal Rehabilitation Website is to create a centralized platform that connects pet owners with rehabilitation centres, facilitating the seamless rehabilitation and care of animals. The system aims to streamline the process of booking rehabilitation services, ensuring effective communication between users and rehabilitation centres, and providing a secure and user-friendly experience.

1.2) Intended Audience

The intended audience for the Animal Rehabilitation Website includes:

- Pet owners seeking rehabilitation services for their animals.
- People who find stray animals in need of medical attention.
- Rehabilitation centres offering animal care services.
- Veterinarians and medical staff associated with rehabilitation centres.
- Administrators responsible for managing and overseeing the operation of the website.

1.3) Project Scope

The project scope encompasses the development of a web-based platform that consists of two consoles: one for users (pet owners) and another for rehabilitation centres. Users can view and select rehabilitation centres, choose doctors for their pets, book services, and communicate with the centres. Rehabilitation centres can manage information

about animals under their care, view doctor details, receive online bookings. The website will also integrate features such as a payment gateway for service transactions, ensuring a comprehensive and efficient system for animal rehabilitation.

2) Overall Description

2.1) Product Features

Common Features:

User Authentication:

Secure login mechanisms for both users and rehabilitation centres, ensuring data privacy.

Responsive Design:

Ensure the website is accessible and user-friendly across various devices and screen sizes.

Data Security Measures:

Implement measures to secure user and animal data, protecting against unauthorized access and data breaches.

2.2) Operating Environment

The website should be compatible with modern web browsers (Chrome, Firefox, Safari).

Mobile responsiveness is required for users accessing the website from smartphones and tablets.

2.3) Design and Implementation Constraints

The system will be developed using ReactJS and Next.js.

Use of a non-relational database management system(MongoDB) for data storage.

2.4) Assumptions and Dependencies

It is assumed that users have a stable internet connection for accessing the website.

The successful operation of the system depends on the availability and reliability of external services such as payment gateways.

The rehabilitation centres are assumed to have the necessary infrastructure for handling animal pickups and medical care.

Users are responsible for providing accurate and up-to-date information about their pets during the booking process.

2.5) Life Cycle Model

We will be using the Spiral Life Cycle Model for developing the website.

3) System Features

3.1) Function Requirements

User Module

Registration:

- Users can register using email or social media accounts.
- Registration includes profile creation with basic information and pet details.

Search:

- Users can search for rehabilitation centers based on slot availability, animal species and ratings.

Profile Management:

- Users can edit personal information and manage their pet profiles.
- Upload photos/documents of medical records for pets.

Reviews and Ratings:

- Users can leave reviews and ratings for rehabilitation centers and vets.

Payment Integration:

- Centres can view and manage transactions related to rehabilitation services.

- Integrated payment gateway for processing payments securely.

Rehabilitation Center Module

Registration:

- Rehabilitation centers can register and create profiles with detailed information about their facilities and services.

Profile Management:

- Rehabilitation centers can manage their profiles, update services, and provide contact information.

Manage Animals:

- Rehabilitation centres can view and manage information about animals under their care.
- Add new animals to the system, including details like species, breed, and health status.
- Update information about existing animals, such as treatment plans and progress.

Doctor Details:

- Centres can view and update information about doctors associated with their facility.
- Include details about qualifications, schedules, and specialization areas.

Booking Management:

- Receive and manage online bookings from users.
- Confirm appointments and update users on the status of their pets.
- Mark completed services and generate invoices for transactions.

Administrator Module

User Management:

Administrators can manage user accounts, permissions, and access logs.

4) External Interface Requirements

4.1) User Interfaces

Responsive UI using NextJS for a seamless experience across devices.

4.2) Software Interfaces

MongoDB for document storage.

Utilize RESTful APIs for communication between the front end and back end.

4.3) Hardware Interfaces

Server Infrastructure:

Hardware infrastructure capable of handling concurrent user requests and database transactions.

End-User Devices:

The website should be accessible from standard end-user devices such as desktops, laptops, tablets, and smartphones.

4.4) Communication Interfaces

APIs for External Services:

Integrate with external services, such as payment gateways, using secure APIs.

5) Non-Functional Requirements

5.1) Performance Requirements

- The system should respond to user interactions within 20 seconds.
- Concurrent user capacity: The website should support a minimum of 500 concurrent users.
- The database should handle a load of at least 500 requests per minute.

5.2) Safety Requirements

- The system should ensure the secure and confidential storage of user and animal data.
- Regular backups of the database should be performed to prevent data loss.
- In case of unexpected system failures, there should be a mechanism to recover critical data.

5.3) Security Requirements

- All communication between the user, rehabilitation centres, and the server should be encrypted using HTTPS.
- User authentication should be secure, employing hashed passwords and secure session management.
- The system should be protected against common web vulnerabilities such as SQL injection and cross-site scripting (XSS).

5.4) Software Quality Attributes

Reliability:

- The system should have an uptime of at least 99.9%.

- It should be resilient to server failures, ensuring continuity of service.

Maintainability:

- Code should be well-documented and adhere to coding standards.
- Provide an admin interface for easy management of user accounts and system configurations.

Scalability:

The system architecture should allow for easy scaling to accommodate an increasing number of users and rehabilitation centres.

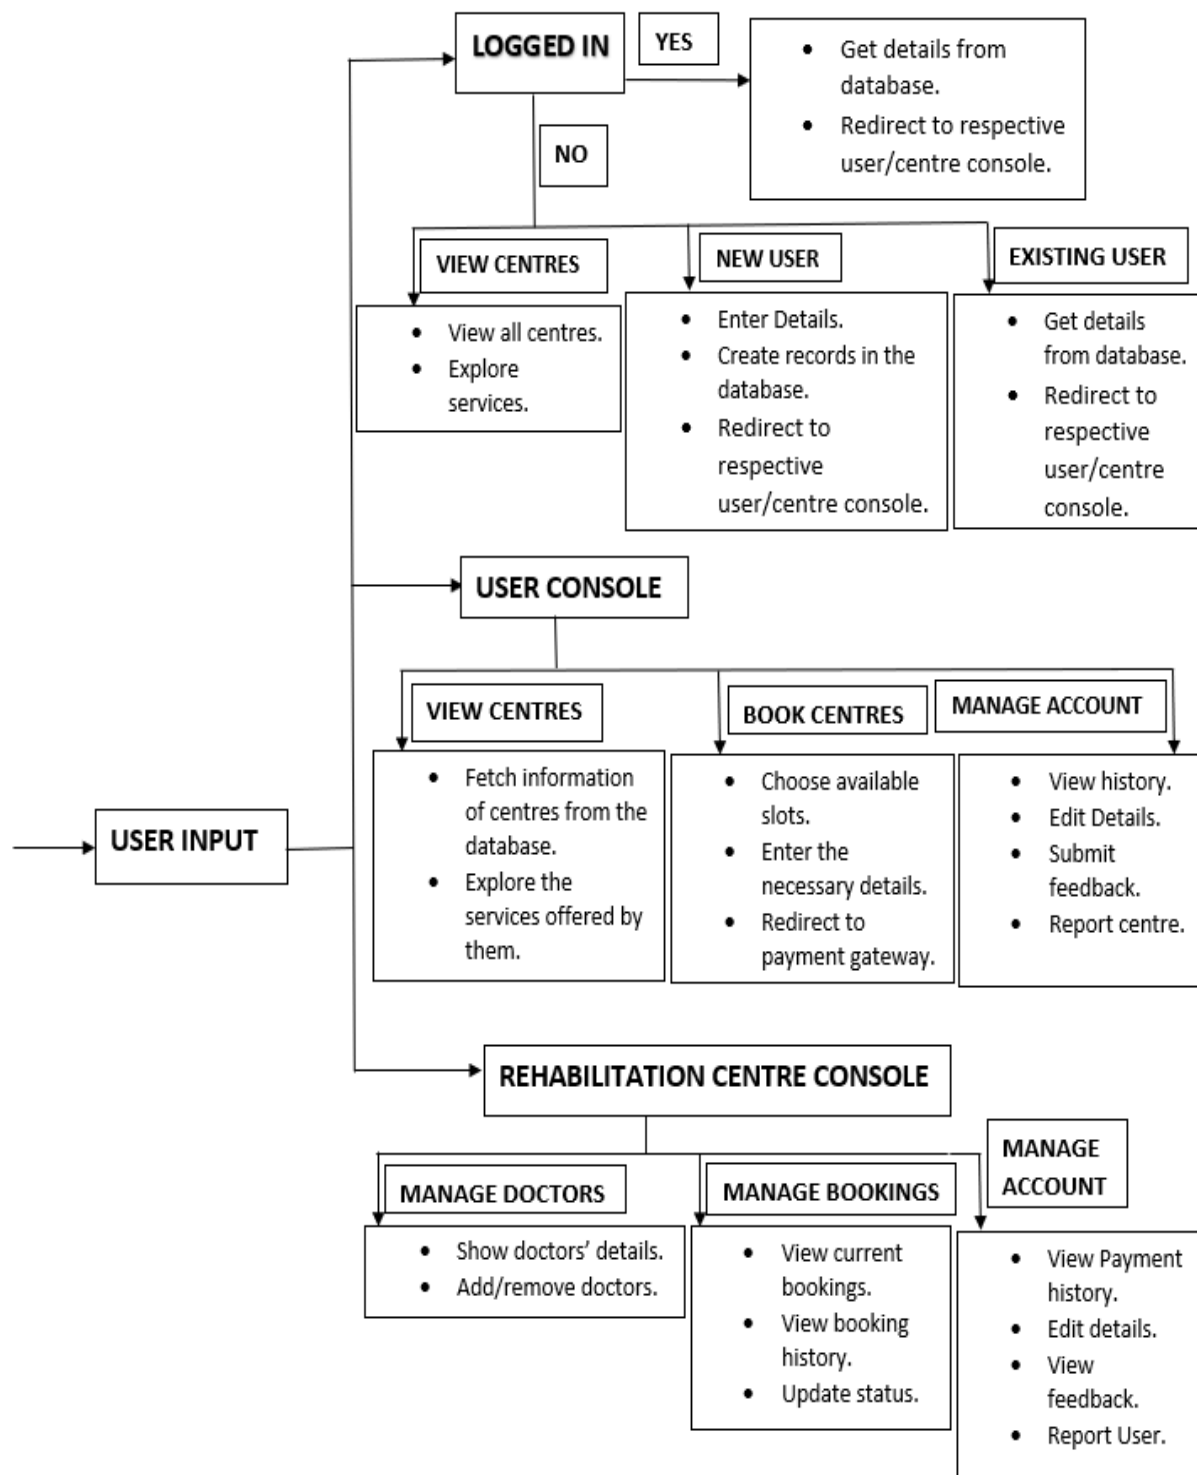

Usability:

The user interface should be intuitive and user-friendly.
